1 2 3

A stacked bar chart with 100 bars on the x-axis. The y-axis represents 'membership probability' from 0.0 to 1.0. Each bar is composed of three segments: light blue (category 1), orange (category 2), and brown (category 3). The distribution of membership is highly variable across the samples. For example, the first bar is almost entirely blue, while the second is almost entirely orange. Many bars show a mix of all three colors, with the brown segment often being the largest. The total height of each bar is consistently 1.0.
